Congratulations! You passed!

Next Item

1. What does a neuron compute?

A neuron computes a linear function (z = Wx + b) followed by an activation function

Correct

Correct, we generally say that the output of a neuron is a = g(Wx + b) where g is the activation function (sigmoid, tanh, ReLU, ...).

- A neuron computes a function g that scales the input x linearly (Wx + b)
- A neuron computes an activation function followed by a linear function (z = Wx + b)
- A neuron computes the mean of all features before applying the output to an activation function

2. Which of these is the "Logistic Loss"?

- $\bigcirc \quad \mathcal{L}^{(i)}(\hat{y}^{(i)}, y^{(i)}) = \mid y^{(i)} \hat{y}^{(i)} \mid^2$
- $\mathcal{L}^{(i)}(\hat{y}^{(i)}, y^{(i)}) = max(0, y^{(i)} \hat{y}^{(i)})$
- $\bigcirc \quad \mathcal{L}^{(i)}(\hat{y}^{(i)}, y^{(i)}) = \mid y^{(i)} \hat{y}^{(i)} \mid$
- $\mathcal{L}^{(i)}(\hat{\mathbf{y}}^{(i)}, y^{(i)}) = -(y^{(i)}\log(\hat{\mathbf{y}}^{(i)}) + (1 y^{(i)})\log(1 \hat{\mathbf{y}}^{(i)}))$

Correct

Correct, this is the logistic loss you've seen in lecture!

 Suppose img is a (32,32,3) array, representing a 32x32 image with 3 color channels red, green and blue. How do you reshape this into a column vector?

1/1 point

- x = img.reshape((32*32,3))
- x = img.reshape((1,32*32,*3))
- x = img.reshape((32*32*3,1))

Correct

x = img.reshape((3,32*32))

 $4. \quad \text{Consider the two following random arrays "a" and "b":} \\$

1 a = np.random.randn(2, 3) # a.shape = (2, 3) 2 b = np.random.randn(2, 1) # b.shape = (2, 1) 3 c = a + b

What will be the shape of "c"?

- The computation cannot happen because the sizes don't match. It's going to be "Frror"!
- c.shape = (2, 3)

Correct

Yes! This is broadcasting, b (column vector) is copied 3 times so that it can be summed to each column of a

- c.shape = (3, 2)
- c.shape = (2, 1)

 $5. \quad \text{Consider the two following random arrays "a" and "b":} \\$

1 / 1 point 1 a = np.random.randn(4, 3) # a.shape = (4, 3) 2 b = np.random.randn(3, 2) # b.shape = (3, 2) 3 c = a*b

What will be the shape of "c"?

The computation cannot happen because the sizes don't match. It's going to be

Correct

Indeed! In numpy the "*" operator indicates element-wise multiplication. It is different from "np.dot()". If you would try "c = np.dot(a,b)" you would get c.shape = (4, 2).

- c.shape = (4,2)
- c.shape = (4, 3)
- c.shape = (3, 3)

6. Suppose you have n_x input features per example. Recall that $X=[x^{(1)}x^{(2)}...x^{(m)}].$ What is the dimension of X?

1/1 point

- (m,1)
- (n_x, m)

Correct

- (1,m)
- (m, n_x)

 Recall that "np.dot(a,b)" performs a matrix multiplication on a and b, whereas "a*b" performs an element-wise multiplication.

1/1

Consider the two following random arrays "a" and "b":

```
1 a = np.random.randn(12288, 150) # a.shape = (12288, 150)
2 b = np.random.randn(150, 45) # b.shape = (150, 45)
3 c = np.dot(a,b)
```

What is the shape of c?

- c.shape = (150,150)
- c.shape = (12288, 45)

Correc

Correct, remember that a np.dot(a, b) has shape (number of rows of a, number of columns of b). The sizes match because :

"number of columns of a = 150 = number of rows of b"

- c.shape = (12288, 150)
- The computation cannot happen because the sizes don't match. It's going to be "Error"!

8. Consider the following code snippet:

How do you vectorize this?

c = a + b.T

Correct

- c = a.T + b
- c = a.T + b.T
- c = a + b

 $9. \quad \text{Consider the following code:} \\$

```
1 a = np.random.randn(3, 3)
2 b = np.random.randn(3, 1)
3 c = a*b
```

What will be c? (If you're not sure, feel free to run this in python to find out).

 $\begin{tabular}{ll} \hline \textbf{(S)} & \textbf{(S)$

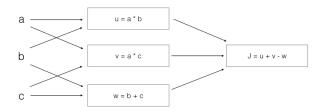

Correct

- This will invoke broadcasting, so b is copied three times to become (3, 3), and * invokes a matrix multiplication operation of two 3x3 matrices so c.shape will be (3, 3)
- This will multiply a 3x3 matrix a with a 3x1 vector, thus resulting in a 3x1 vector. That is, c.shape = (3,1).
- It will lead to an error since you cannot use "*" to operate on these two matrices. You need to instead use np.dot(a,b)

10. Consider the following computation graph.

What is the output J?

- $\int = (c 1)*(b + a)$
- $\int = (a 1) * (b + c)$

Correct

Yes. J = u + v - w = a*b + a*c - (b + c) = a * (b + c) - (b + c) = (a - 1) * (b + c).

- $\int a^*b + b^*c + a^*c$
- $\int J = (b 1) * (c + a)$
